PARCEL TRACKER

Color palette grouped by hue family

This version is organized by actual hue family rather than by raw token category. The important part is that the system now has fewer real color families: neutrals, one accent family, one warning family, and one danger family. Supporting and less-used derived tokens are grouped separately below in a smaller section.

- Reduced system: 4 real color families

The system intentionally keeps semantic names like `status-live` and `status-info`, but both now resolve from the same accent family instead of introducing extra independent hue families.
